Google Maps is an online mapping and consumer platform created by Google that offers trip planning, real-time traffic information, street view and more. Hundreds of millions of people use it every month, and the services are built into millions of websites. What are the most important features of Google Maps? Route planning. You can easily plan a route from your current location to your destination and get multiple possible routes based on many factors, including travel modes such as car, public transport, walking, cycling and flying. You'll almost always find your way wherever you are and wherever you're going, because Google Maps covers hundreds of countries. Search for places. Want to know where certain types of places are nearby, such as bakeries or restaurants? Don't worry, just type in the type of place or business you're looking for and Google Maps will show you all of them in your area. The icing on the cake is that some restaurants can even order delivery directly from Google Maps. Live View. Using your phone's camera, Live View lets you navigate and find your way. The service shows you the path in real time from the camera's point of view and makes the whole process easier, it really adds something. They also plan to provide Live View to share location data. A real-time Google information. With all the users and data that Google Maps can handle, you can view real-time information, including traffic information, closures, accidents, you can also see future traffic conditions based on daily data, so you can see when streets or buses are full and adjust your schedule to get the best conditions. Offline navigation: To always have access to all available maps and information, you can download maps and even use them offline. This is a feature you'll enjoy if you don't have internet. Share Location: You can share your location with others in real-time or in a specific place to meet people easily. © Google After installing Google Maps, you can enter your destination directly. Then enter your location manually or enable geolocation so Maps can find you in real time. Take a trip, order something or share your location with other people. After clicking the download button at the top of this page, you need to log in to your Google account and you will see an icon on the right side of the address bar. Click on it to install the Google Maps enhanced web app and the Google Maps apps will appear in your system tray or app dock. © Google It's 100% free if you use Google Maps for personal use, but you have to pay if you need to use Google Maps API. While you can use Android without learning the meaning of APKs, a little research will help you better understand and appreciate the platform. Let's take a look at what an APK file is and why it's important to Android. What is an APK file? APK stands for Android Package (sometimes Android Package Bundle or Android Application Package). This is the file format used by Android to distribute and install apps. As a result, the APK file contains all the elements that the app needs to install properly on your device. An APK is an archive file, which means it contains multiple files, along with some metadata about them. You probably know other ways files such as ZIP and RAR. Typically, archive files (such as ZIP) are used to combine multiple files into one to make them more portable or to compress to save space. When an archive is used to distribute software, it is called a software bundle. As it turns out, APK files are a variant of the JAR (Java Archive) file format as most of Android is built in Java. All APK files are ZIP files by nature, but they must contain additional information to work properly as APK files. So all APK files are ZIP files, but not all ZIP files are APK files. If you are interested, you can open the APK file and see what's inside. Just use one of the best file extraction tools like 7-Zip to open it like any old ZIP file. There's not much you can do with APK files on non-Android platforms unless you install an Android emulator like Bluestacks. APK files allow you to install apps on your Android phone. They are similar to the APPX files used to install Store apps on Windows 10, as well as the corresponding package files on other platforms. When you open the APK file on your device, it contains instructions to install it on your phone and provides your device with information about the package itself. Normally, when you visit Google Play and download or update an app, the store will automatically install the APK file for you. In this way, the Play Store also acts as a package manager, a tool to easily install, update, and remove software from your device. However, due to the open nature of Android, Google Play is not the only way to find and install APK files. It's easy to download the APK file from elsewhere, transfer it to your device, and then install it manually. Learn how to download Android apps for a full guide. When a developer creates an Android app, they most likely use Android Studio, the official Android development tool. When the app is ready to ship, Android Studio compiles it and puts everything into one container, the APK file. APK files can be named anything, but you usually need to keep the .apk file extension for operating systems to interpret them. When you download an APK file, you'll usually find it has the following file names: com.google.android.dialer 66.0.374464860.apk This is the (shortened) version of the APK file name for the Google Phone app. The full app name matches the app file name on its Google Play page URL. At the end, it presents the current version, which can be very detailed, because important applications like this are constantly updated. Google Play is great for most people who need to install Android. However, installing the APK file manually has several advantages. One of the most important is to get access to the latest version of the apps in advance. When a major Google app (such as Google Calendar) releases a major update, it can take a week or more for your device to get the latest version from Google Play. If you install the APK yourself, you won't have to wait and update as soon as you want. Unreleased APK files for image downloads also allow you to install apps on your device that are not available on Google Play. You might find an app that isn't allowed on Google Play because it violates policies, or you might want to test your friend's app that's currently in development. However, as with desktop software, downloading APK files from random websites can be dangerous. Although Google Play includes filters to detect dangerous apps, there isn't much protection if you install the APK file yourself. They can be malware disguised as legitimate applications, or they can be faked to contain spyware. Only download APK from trusted sites. Beware of sites that promise you a free paid app - this is a common tactic to install malware on your device. You might have come across a base.apk file on your phone and wondered what it does. You can only view these base.apk files if you have root access on your phone because they are located in protected system folders. This is the file where you can find the application folder. It contains an APK file downloaded from Google Play and used to install the app for the first time. If you compare the size of this file with the file size listed on the app's Play Store page, they should match. APK backup apps can use them to back up installed apps on your phone. If you wish, you can also manually copy these files to another location for your own use. However, it is not necessary to back up your Android device, so don't worry about these files if you don't have root. And if you see them, don't panic as it's a normal part of how Android works. We looked at how APK files are the main format Android uses to distribute and install apps. In most cases, they are invisible during normal use. But APKs power all the downloads on your phone, so you're dealing with them all the time without even realizing it. Downloading APKs from sources outside of the Play Store is handy and one of the best parts of using Android. But you should only do this if you trust the origin of the files so as not to expose your phone to security risks.
