Today, technology works truly wonders. Not long ago, it would have been inconceivable that you can adapt a camera, a sanitary and a tetris game all in one device. Now you can do it and more on your smartphone - provided you have the right apps. Google Play Store offers you a wide selection of apps that you can download on your Android devices. If you are just looking for a great fun, you can also find music, ebooks and movies on the game store. It really is a one-stop-google Play Store store has a wide range of apps, books, music and movies available. You can find almost everything you need from Time Trackers for your office to games for your children. Google Play Store is a great resource for apps, games, books and movies that you can use on your phone. You simply need to access your Google account to start the purchase of app on your mobile device. You can also run the Google Play Store application on your PC, however you will need to use an emulator - which is quite simple. You can choose which apps you want to see on your app menus or even add nicknames to your devices for easy identification. If you ever lose one of your devices, you can simply hide them so that they don't see more when you make a future purchase or download any app from your computer. Google Play Store has thousands of apps, books, music and movies available for download. You can find applications for almost all areas of your life, work or game. Configure payment information by accessing your Google Play account and clicking on "Add a payment method". From there, you will receive instructions on how to enter your billing information. Safety First! You don't have to worry about putting your payment details online while Google is seriously seriously about due diligence to keep you safe. Google Play Protect executes security checks on Play Store applications before downloading them. This helps you avoid any malware that could cause damage to your devices. Google also knows how many people rely on users - reviews to decide purchases, and seriously take product reviews. In order to combat the growing trend in the fake auditors, they have already set up measures to prevent them. Google has deployed a system that combines human intelligence and automatic learning to detect deceptive revisions and enforce policy violations against the accounts and developers who use them. In this way, you are sure that the reviews you read on Play Store are published by real users and are useful in your decision-making process. Where can you run this program? The Google Play store will run directly on your Android device. Performing the application on the PC will require an emulator. You can also get the Google Play extension for your Chrome browser for easy access and comfortable download options. Is there a better alternative? If you don't want to use Google Play Store to buy your Android apps, there are some alternatives to choose from. Front and Center is the Amazon App Store for Android. Amazon is actually Google's largest competitor when it comes to distributing mobile applications for end users. They offer a vast selection of apps, books, movies and songs at very low prices. Check them if you want to save a couple of dollars. Another option is Getjar, which offers a catalog of thousands of apps and games. It is quite popular among long-standing Android users and its website is one of the most ancient in the download sector. I also like F-Droid, however, unlike the sites mentioned above, F-Droid offers only free and open source apps as it is a non-profit organization. You can join their community to help or Funds to the creators - It's a great way to help support app developers! Google Play Store is the most efficient and secure way to get the apps you need on your Android device. It is also very simple to synchronize all your devices - everything you need is a Google account. Moreover, the company is very much For safety and keep data safe. You can rest easily knowing that your personal data is safe. Will you have to download it? Yes, highly recommendable. You can visit their website and simply log in with your existing Google account or create a new one. It's super easy! If you really need to use the mobile application on your computer, you need to use an emulator like BlueStacks.Highswide App selection and multimedia (books and music but also films) Synchronize your accounts and devices easily some apps for more money than FREE COMPETITORS Multi-platform Sharing Appfree Video Editing Integral Appfree Video Player with Great FeaturesFree 2nd Phone Mobile Numbertost & Share your photos and videosFree Application Enabling game Featuresyncing Your life with your App Free Battle Royale Shooting Free Gamea App Store for GamersFree Dictionary and Translation AppIt week, Google rolled a new version of Android to very little fanfare and a nice lot of boredom. There is a reason for this: Google Play Services.Back in September 2012, Google released a new app to the Play Store. It has allowed the company to unlock new functionality to Android users who run 2.2 and up to get an update of the complete operating system. This app, Google Play services, has been the focus of Google's latest I / O. And, like Android 4.3 demonstrated, it is a powerful tool to bring new features to users of old operating systems. So how does this new platform work, and how does it differ from Android? Only what is Android? To understand why Google Play the services count, we need to understand what is Android. Most people are supposed to "Android" means "a phone running Google Software." This is not always the case. Technically speaking, Android is an operating system for mobile devices. Because it is Open Source, a company can use it, modify it and make it alone without involving with Google. The Kindle fire is the most obvious example of this. While executing Android, the game store is missing, any integrated Google service, or even any google mention. Instead, Amazon has built its App Store, content services and hardware. This is what Android is. A platform for any company to be built. The reason why Google and Android were so intertwined so far because, to access the Play Store (or, previously, the Android market), device manufacturers had to adhere to some series of rules and include some apps or Google's functionality. This kept Google at the center of the operating system in his early stages. However, Google started the process of separation from Android long ago. Most Google apps are already separate that Google has published Google Android 2.0, the worries were already starting to assemble. A new new new turn-by-turn navigation feature was going to ship on the brand new Motorola Droid. However, it was also released to the Android market the following month. This started a trend of Google releasing new features through app updates instead of operating system updates. Free browsing without Google's loggers for maps is the news this morning, and even in beta, have read further years, gmail, research (including google now and voice actions), the findings (previously talk), Chrome (previously the stock browser), YouTube, Calendar, and even the Android Android keyboard have been disaggregated by Android and updated directly. This has brought waiting time for new features from a six-month approximate minimum to a complaint a few days, until your device could handle it. The problem with this plan, though, is that it doesn't have to Google to update Android features. Every new version of Android will bring new APIs that developers could connect. This is why some apps require 4.0 while others can work on Android versions starting from 2.2. The apps in the previous category required the new APIs. This is a problem for Google, and it's the reason why "fragmentation" is a word so ugly. So the new plan.google Play is the new platform that spent last year on Google Google The company announced a series of new features that were coming to Android devices. They include, but are not limited to: there was a neat thing that all these features had in common: they don't need a new version of Android to be implemented. In fact, nobody on the stage didn't even talk about an Android update during the entire I / O Keynote three hours. Instead, these features have been added to Google Play Services, which is supported on Android 2.2 and up. For the first time in years, users with an old device that had been abandoned by the producers have got to enjoy new features that have just been announced in I / O.in contrast, Android 4.3 introduced the following features: most Of the new Functionality Aren is exactly less important, but they are not so great in the context. The synchronization of the notification, for example, will influence the apps across the platform, while automatic automatic commands will probably be seen only by a minority of users anyway. Most producers tend to replace the dialer app with their own version and the big ones have already already feature. Google Play Services offers Google at Stage to launch new features that are fundamental for Google's presence on smartphones and tablets. This means that 98.5% of Android devices can use new things (including the fully new game game app and related features). This effectively solves the problem of fragmentation, at least for the functionality that spread via Google Play Services instead of Android Updates. We have not received a new Verification of Android on Google I / O, but it's not that there weren't enough! The future Morethe is still uncertain, but a little brighter that everything is meant that we will never have any new functionality Criticism through actual Android updates? Certainly not. For beginners, as we have seen in I / O, the existing APIs have yet been rolled in game services, so the work is not yet done. Furthermore, we cannot know what is planning Google along the way. The company has not announced any official announcement on its intentions for future updates. We can simply see the effects of its plans. When Android 5.0 finally pulls out, probably introduce some new problems. What is clear that. More and more, Google is bringing new features to existing devices without users who have to worry about which version of the operating system is active. No more awaits you King six months or a year for a new dessert to roll through the producer and the courier. There are no other devices abandoned after eighteen months because it's too old for it's worth it. Above all, it means many fewer petitions that implore companies to continue updating medium-ray devices. This is the point of Google Play Services. He sits on your phone, silently bringing new things. For example, at some point in recent months, Google has moved its app verification service from Android 4.2 and play services. Your phone is now slightly safer than it was before and no bearer or manufacturers should be involved in any way. The other updates that can be performed this way, better. better.
